

THE DARK ENERGY SURVEY

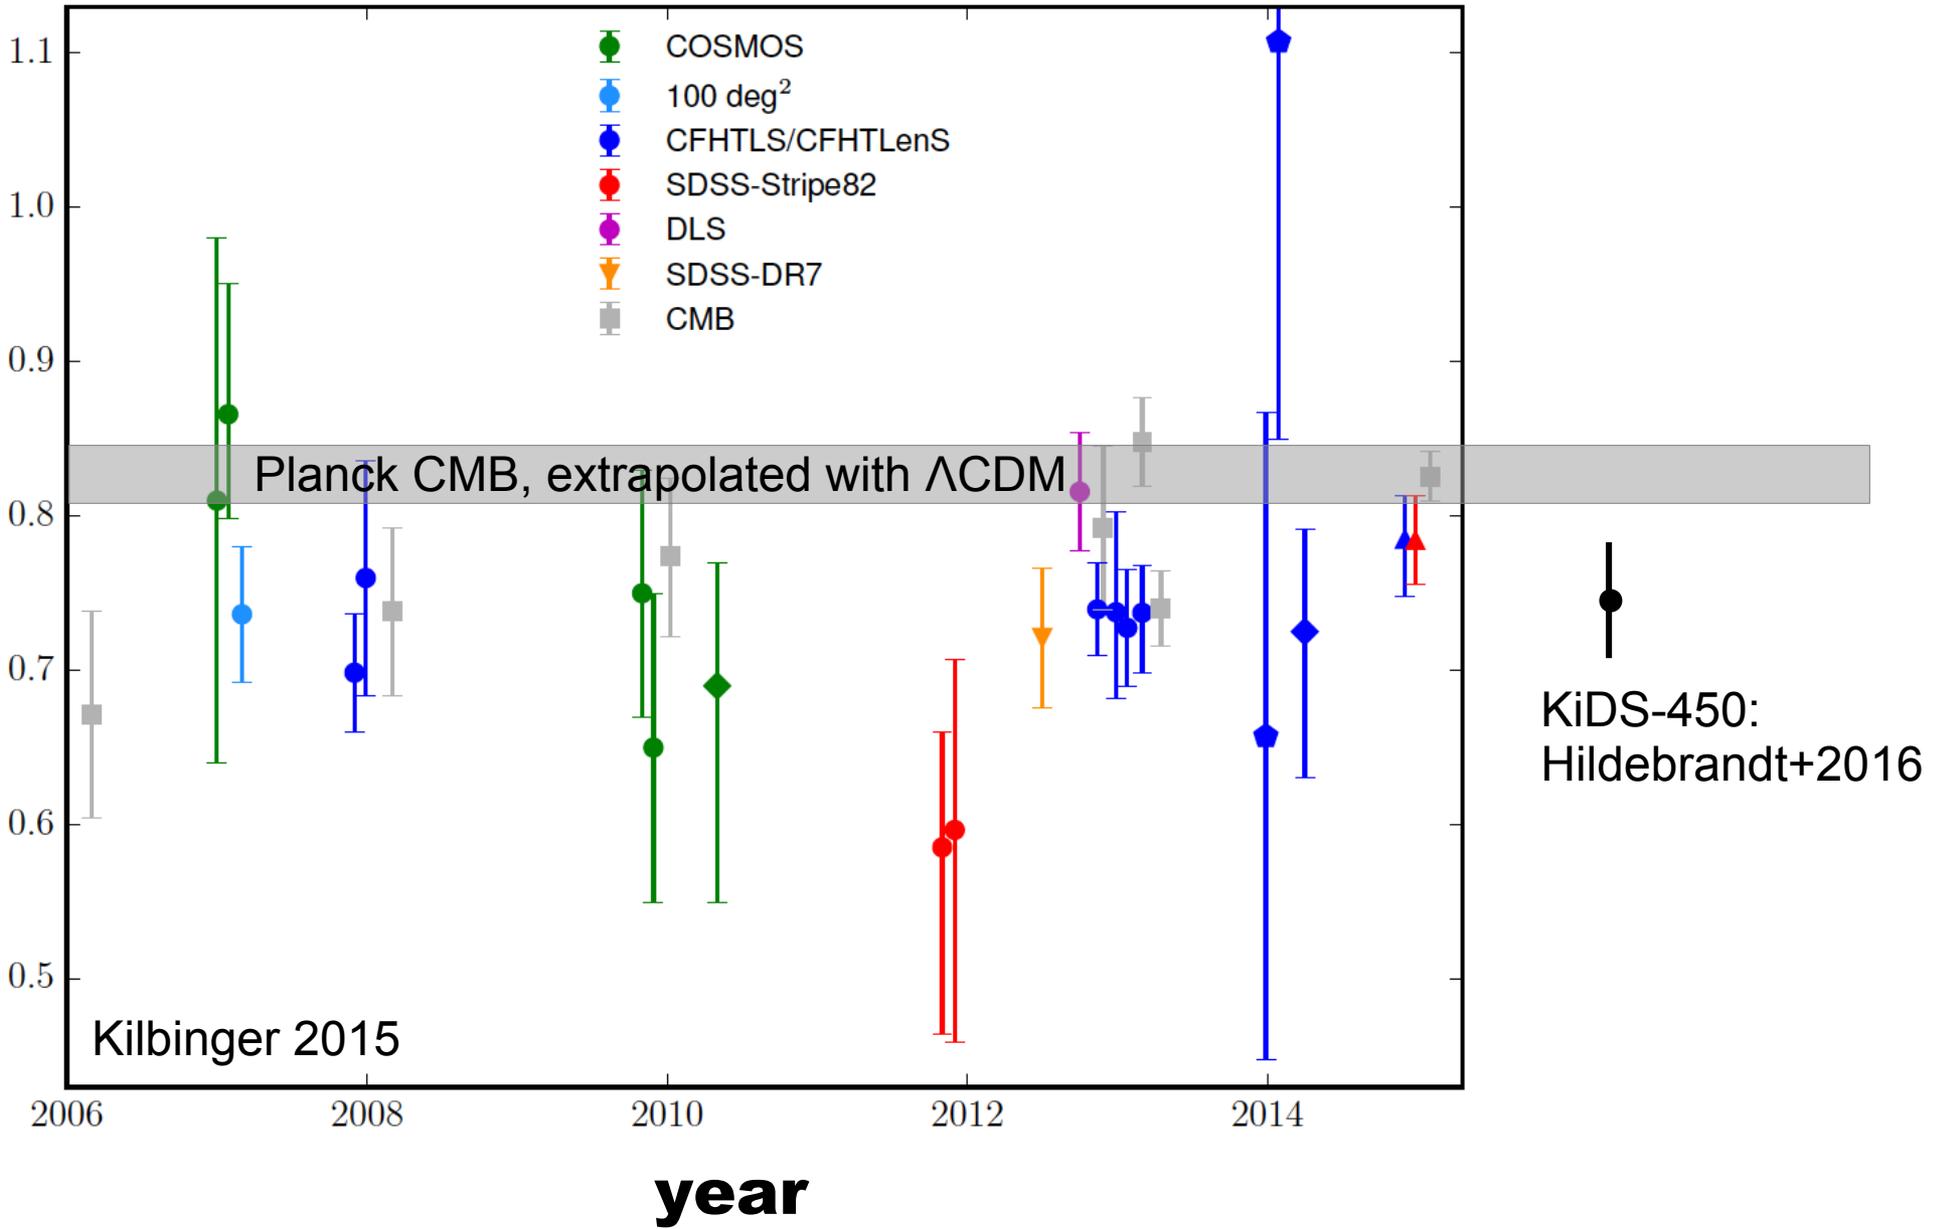

**Cosmology results from  
weak gravitational lensing  
in the Dark Energy Survey**

**Daniel Gruen**, Einstein Fellow at SLAC/KIPAC

and about 400 collaborators

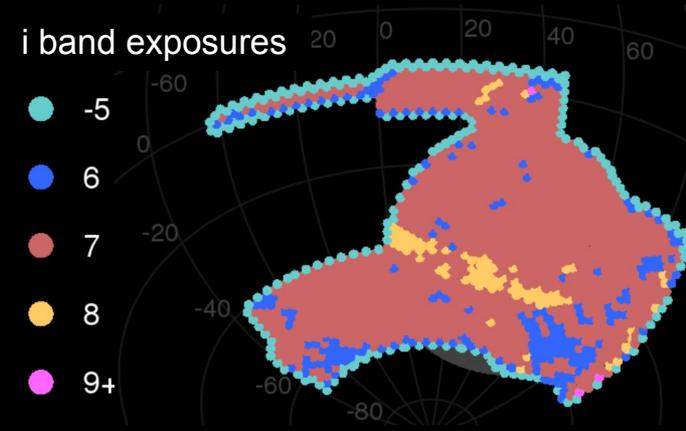

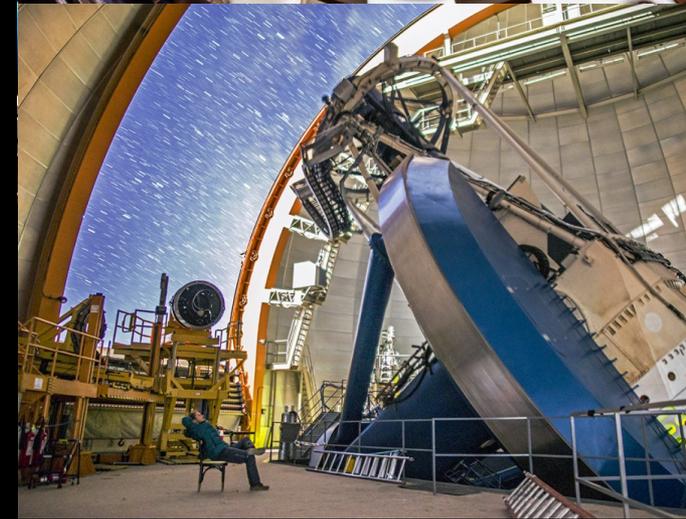

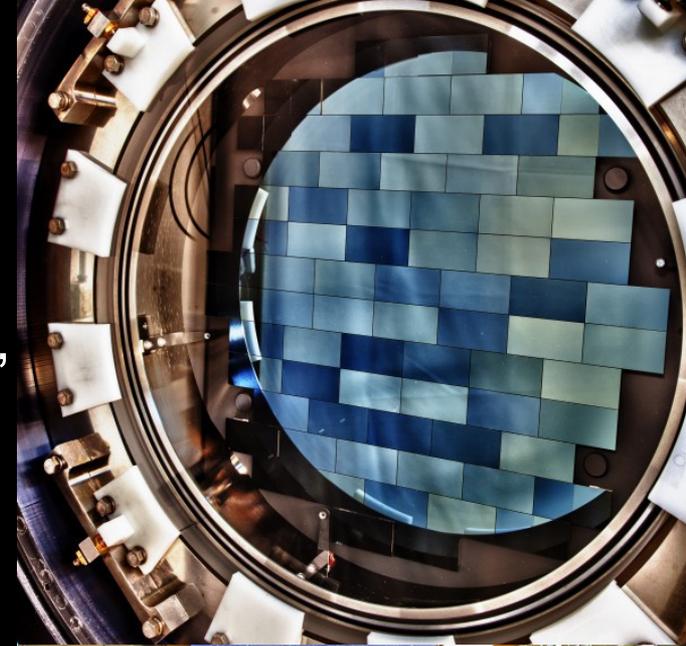

Einstein Fellows Symposium, Oct 13, 2017

**amplitude of structure at present,  $S_8$**

# The Dark Energy Survey

- 5000 sq. deg. survey in grizY from Blanco @ CTIO, 10 exposures, 5 years
- Primary goal: dark energy equation of state
- Status:
  - Y1 (1500 sq. deg, 40% depth): data processed, results on cosmology today
  - Y5 already in progress and going well!

Funded by:

**Gaussian random field:  
Two-point correlation  
captures all information**

**Gravity generates non-  
Gaussianity on all scales:  
PDF not described  
by second moments**

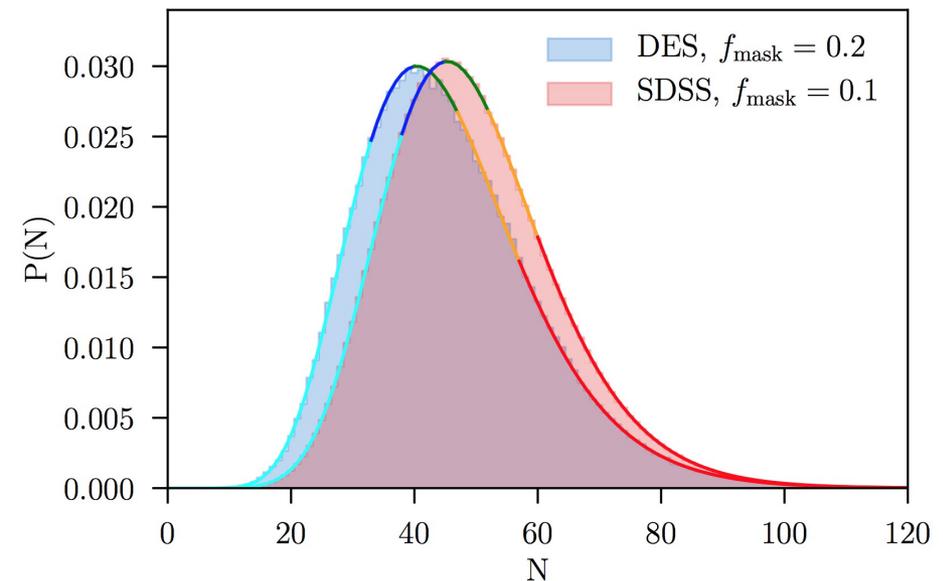

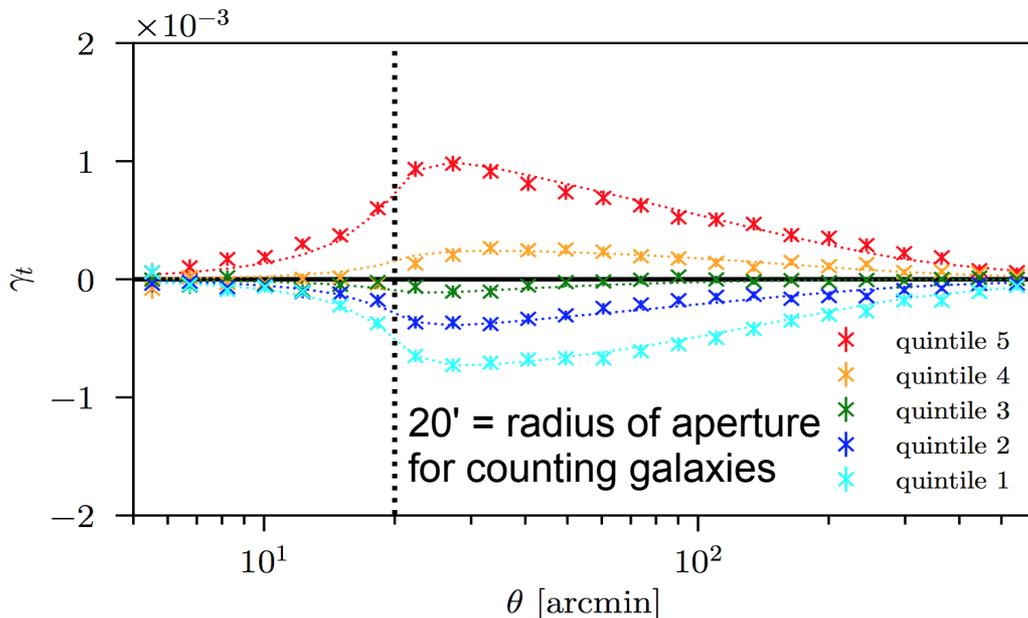

# Cosmology from matter/galaxy PDF with counts and lensing in cells

- Step 1: split lines of sight into quintiles of redMaGiC galaxy count – underdense to overdense

# Cosmology from matter/galaxy PDF with counts and lensing in cells

- Step 1: split lines of sight into quintiles of redMaGiC galaxy count
- Step 2: measure shear around and mean counts in quintiles – there is an asymmetry / skewness!

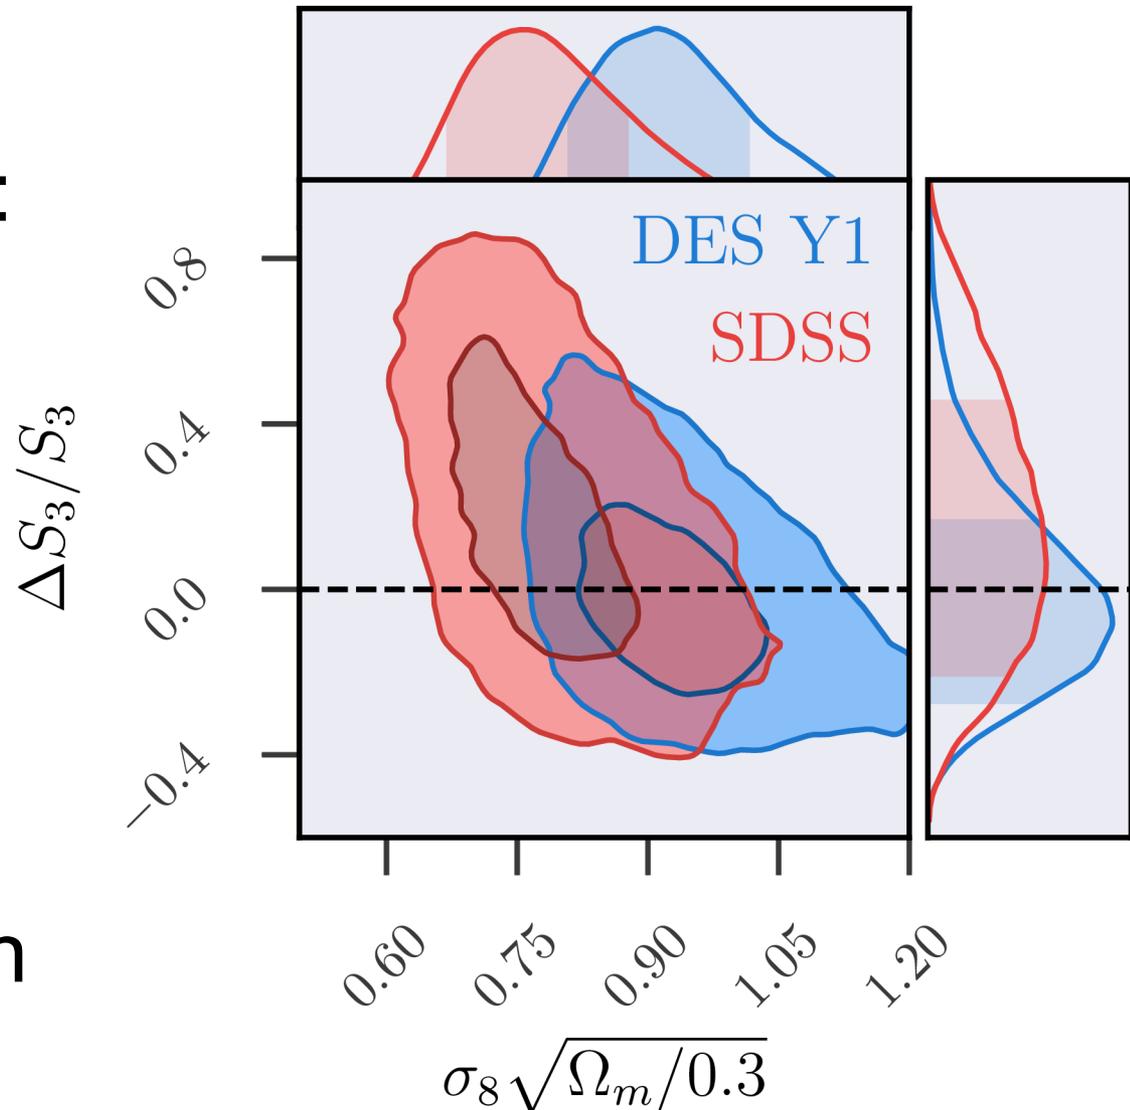

# Cosmology from matter/galaxy PDF with counts and lensing in cells

- Step 1: split lines of sight into quintiles of redMaGiC galaxy count  $N$
- Step 2: measure shear around and mean counts in quintiles
- Step 3: model these signals via **joint PDF** of matter and galaxy density

$$\langle \gamma_t \rangle (N) = \int p(\delta_m | N) \langle \gamma_t \rangle (\delta_m) d\delta_m$$

# Cosmology from matter/galaxy PDF: skewness of matter density

- Counts + lensing in cells jointly constrain:
  - Cosmology
  - Bias + Stochasticity
  - Skewness of matter density:  $S_3 \equiv \frac{\langle \delta^3 \rangle}{\langle \delta^2 \rangle^2}$
- Skewness agrees with  $\Lambda$ CDM prediction at  $\sim 20\%$  uncertainty

DG+, which I really need to submit to arXiv right now, so please don't ask too many questions

# Summary

- Wide range of probes from early & late Universe, geometry & structure, agree on fiducial  $\Lambda$ CDM cosmology
- DES has added the most precise measurement of structure in the evolved Universe
  - Control of systematics with improved, independent methods
  - Competitiveness and consistency with Planck CMB in  $\Lambda$ CDM, insignificant offset, but in the direction of other lensing studies
  - Precise joint measurements close to  $\Omega_m = 0.30$ ,  $\sigma_8 = 0.80$ ,  $w = -1.0$
- First cosmological constraints from matter density PDF: complementary, consistent, and competitive
- Additional results + much more data (Y3) coming soon!
