

An X-ray Imaging Study of RCW49

HII region / massive young star cluster / massive star-forming region

(Tsujimoto et al. 2007, ApJ, 665, 719)

Masahiro Tsujimoto
Pennsylvania State University

Contents —

1. Introduction ... ① ② ③
 - Chandra Imaging of Galactic HII Regions
2. Observations .. ④ ⑤
 - Chandra (X-ray), IRSF (NIR), Spitzer (MIR)
3. Results ⑥ ⑦ ⑧ ⑨ ⑩ ⑪ ⑫
 - (1) Resolving OB assoc., (2) Cluster membership
 - (3) New O stars, (4) Hard O stars, (5) WR, etc.
4. Summary ⑬

9. New early-type star candidates

Color-Magnitude diagram
X-ray sources w/ JHK.

~30 new OB candidates
+ 13 prev-known, spec

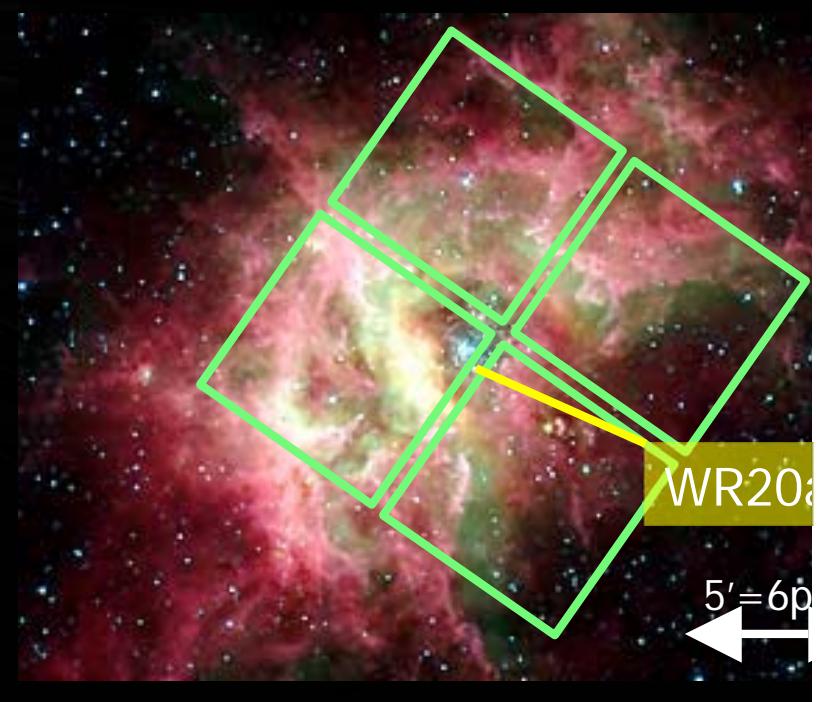

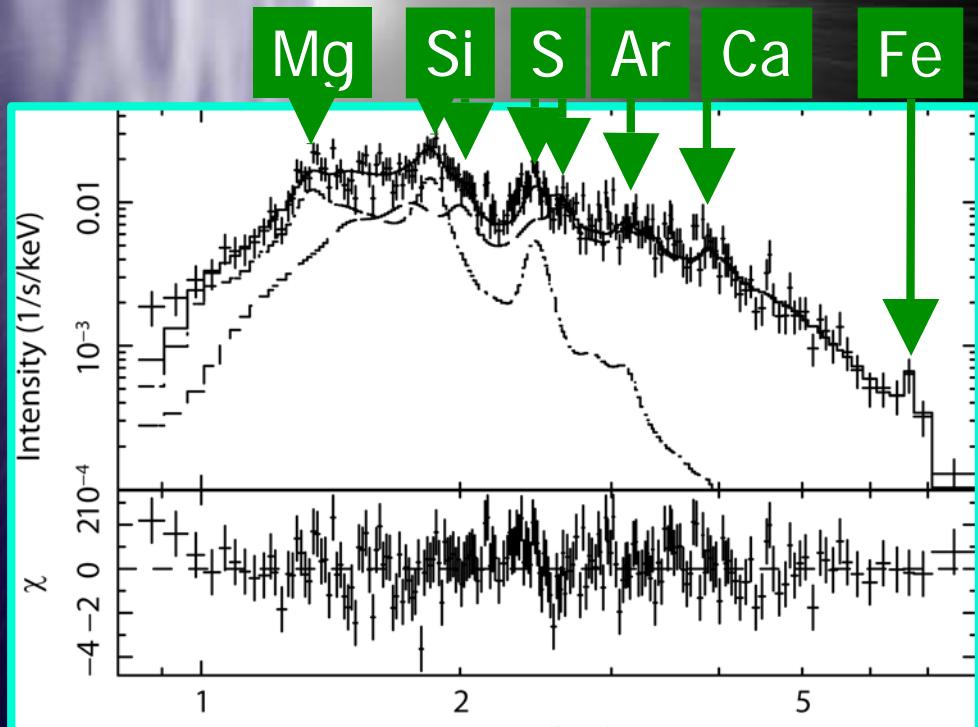

Spatial distr. of new OB

~1/2 are out of OB assoc.
Many OBs may remain unIDed in other mSFR
Spectroscopic follow-up
(AAT, CTIO) this winter

10. Wolf-Rayet binary WR20a

WR20a : “Binary Wolf-Rayet” star: WN6+WN6

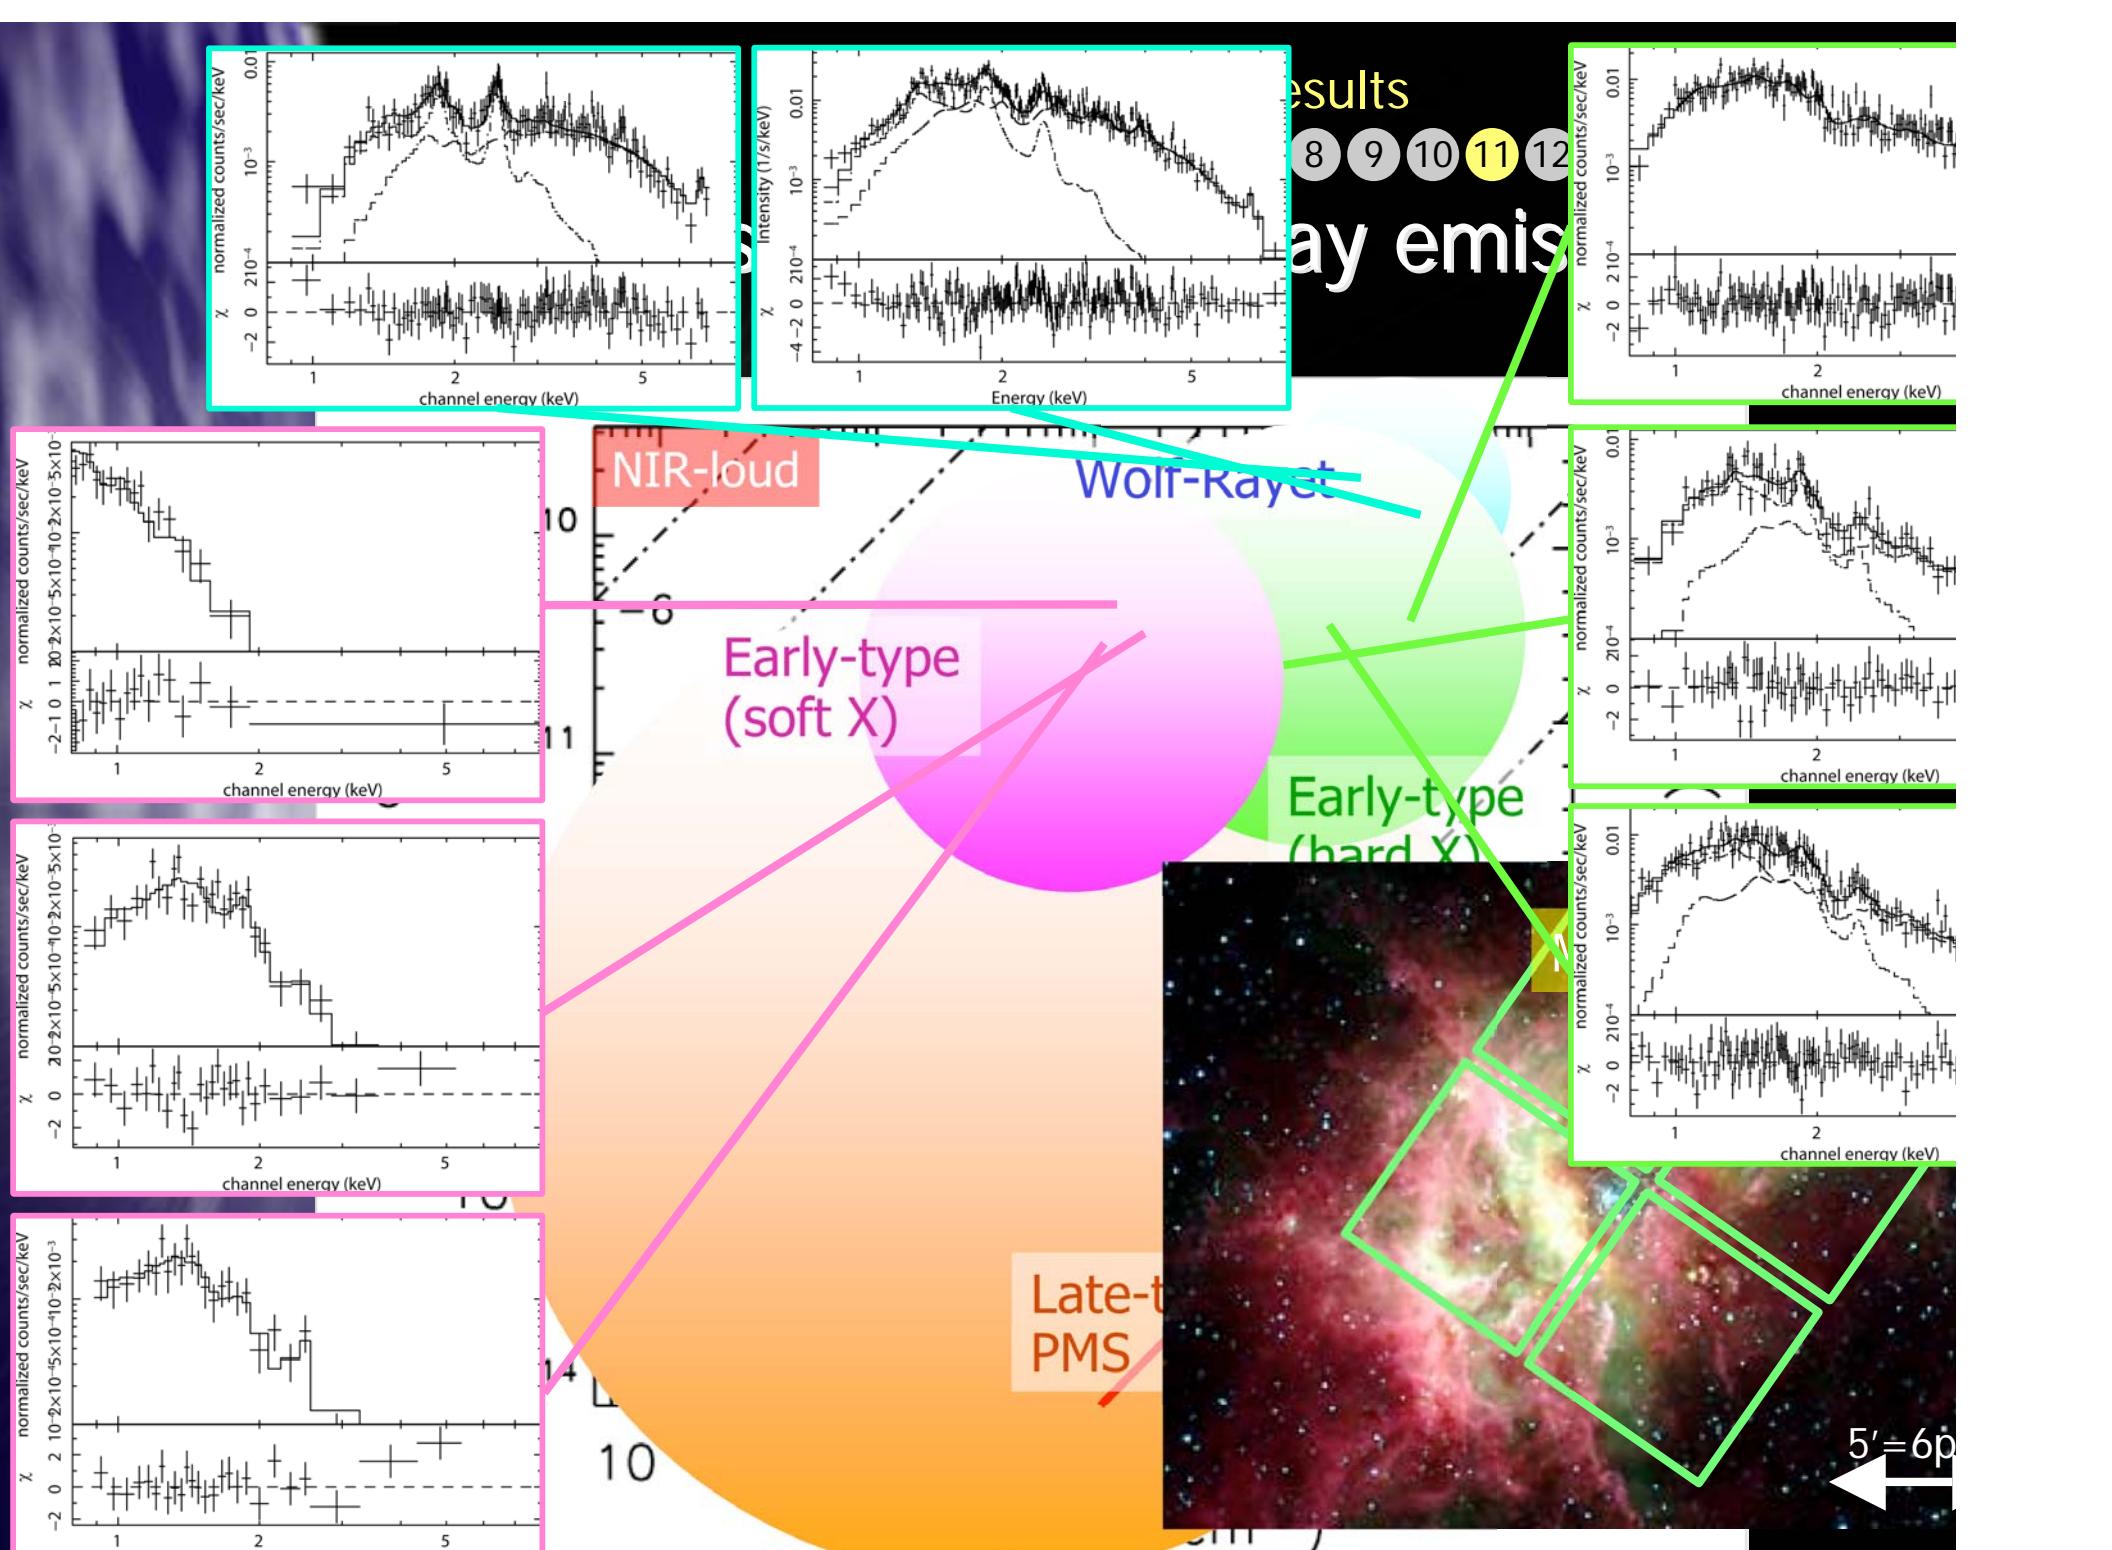

1. An eclipsing binary (Bonanos+ 2004).
 2. Doppler tomography (Rauw+ 2004).
- $M_1 = 83.5 \text{ Mo}$ $M_2 = 82.0 \text{ Mo}$; the most massive pairs.
 - $P_{\text{orb}} = 3.686 \text{ days}$. $\theta_{\text{inc}} = 74.5 \text{ degrees}$.

4 5

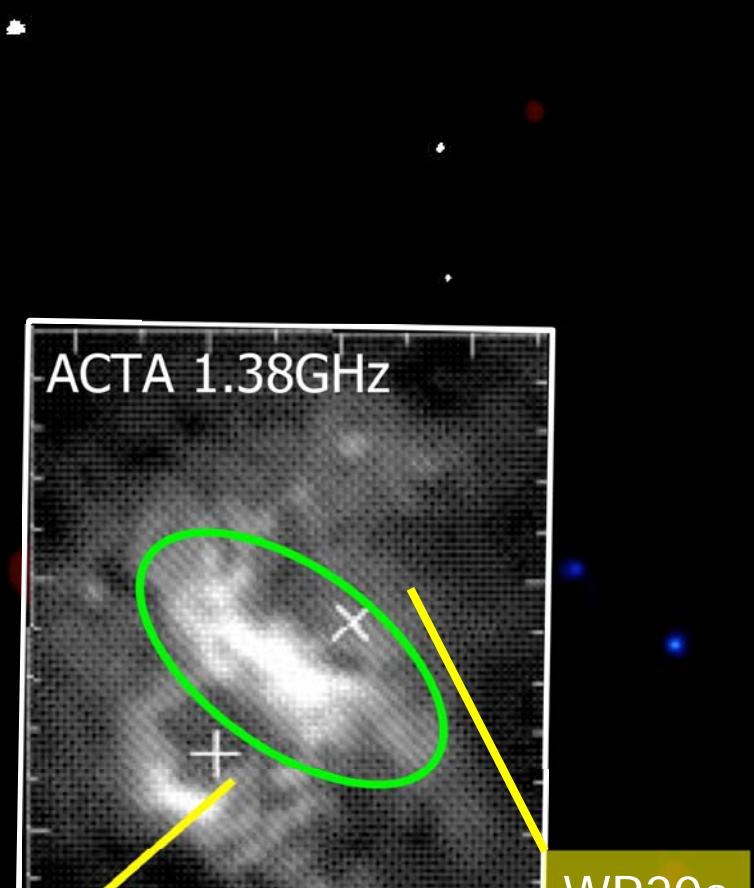

3. Results

6 7 8 9 10 11 12

4. Summary

13

12. Diffuse X-ray and TeV γ -ray emission

TeV γ -ray emission

- 1st from star clusters
- Extended ($\sim 10'$).
- IC, π^0 decay, or else.

Diffuse hard X-rays

- Soft extended emission
- 1.38GHz enhancement

1. Introduction

1 2 3

2. Observations

4 5

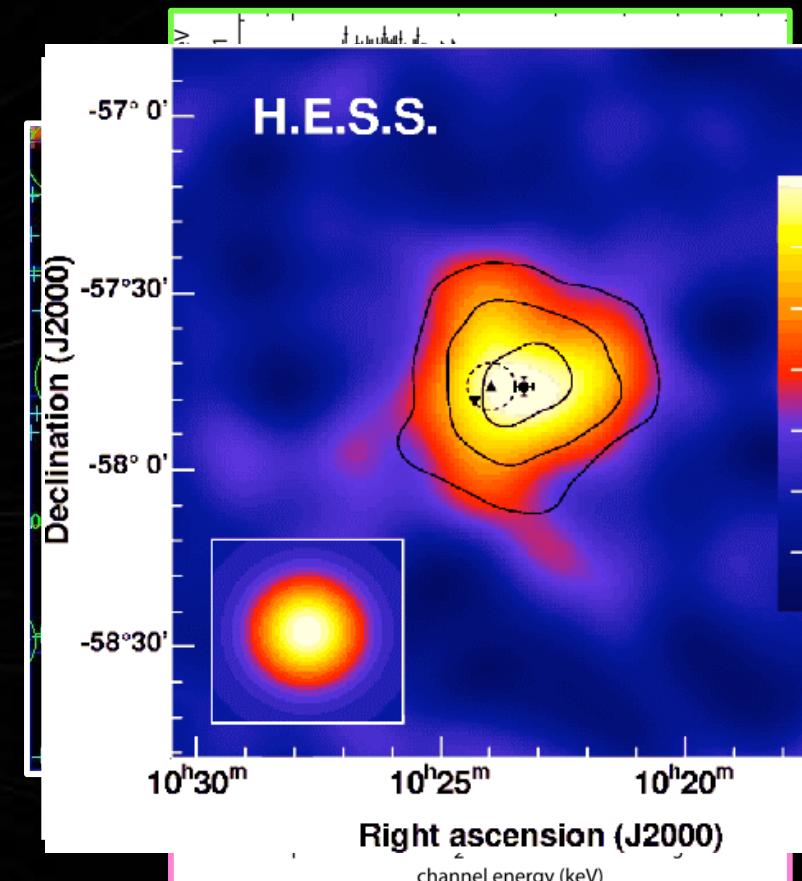

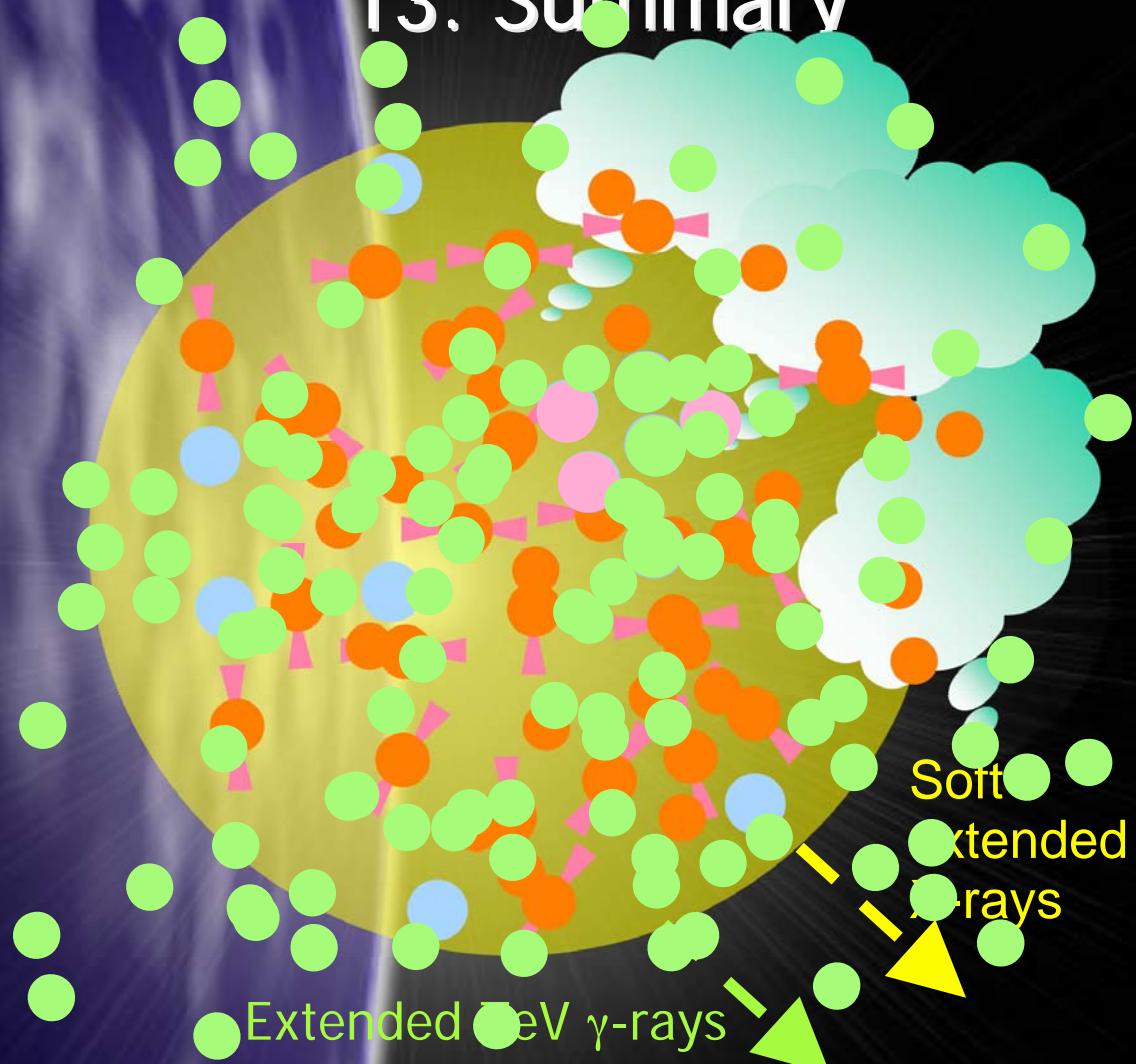

3. Results

6 7 8 9 10 11 12

4. Summary

13

13. Summary

- Many new phenomena found (in other regions, too).
- Important for cluster evolution, effects on ISM, particle accel.
- None of them are identified in low-mass star-forming regions.
