

*AHELP for CIAO 3.4*

## **\_clear\_error**

Context: [slangrtl](#)*Jump to:* [Description](#) [Example](#) [See Also](#)

## **Synopsis**

Clear an error condition

## **Syntax**

```
_clear_error ()
```

## **Description**

This function may be used in error-blocks to clear the error that triggered execution of the error block. Execution resumes following the statement, in the scope of the error-block, that triggered the error.

## **Example**

Consider the following wrapper around the `putenv` function:

```
define try_putenv (name, value)
{
    variable status;
    ERROR_BLOCK
    {
        _clear_error ();
        status = -1;
    }
    status = 0;
    putenv (sprintf ("%s=%s", name, value));
    return status;
}
```

If `putenv` fails, it generates an error condition, which the `try_putenv` function catches and clears. Thus `try_putenv` is a function that returns `-1` upon failure and `0` upon success.
