---

## Synopsis

Add new columns to a table.

## Syntax

```
dmpaste infile pastefile outfile [clobber] [verbose] [kernel]
```

## Description

`dmpaste' copies infile to outfile, pasting on extra columns from the pastefile, which may be a single file or a stack of files. Column names in the pastefile cannot duplicate names in the input file. All files must have the same number of rows. Analogous to the unix `paste' command.

## Example 1

```
dmpaste "data1.fits[EVENTS]" "data2.fits[EVENTS][cols tg_r,tg_d]"  
data3.fits
```

This pastes extra columns tg\_r, tg\_d from data2.fits onto the columns already present in data1.fits, making a new file data3.fits.

## Example 2

```
dmpaste "data1.fits[EVENTS]" data2.fits data3.fits
```

This pastes all the columns from data2.fits onto the data1.fits table.

## Example 3

```
dmpaste "data1.fits[EVENTS][cols -pha]" "data2.fits[EVENTS][cols pha]"  
data3.fits
```

Replace the pha column in data1.fits by the one in data2.fits.

## Parameters

<b>name</b>	<b>type</b>	<b>ftype</b>	<b>def</b>	<b>min</b>	<b>max</b>	<b>reqd</b>
<u>infile</u>	file	input				yes
<u>pastefile</u>	file	input				yes
<u>outfile</u>	file	output				yes
<u>clobber</u>	boolean		no			
<u>verbose</u>	integer		0	0	5	
<u>kernel</u>	string		default			

## Detailed Parameter Descriptions

### **Parameter=infile (file required filetype=input)**

*Input file name*

The input file used as the basis for the new file. The output file will contain all columns from the input file and the header from the input file.

### **Parameter=pastefile (file required filetype=input)**

*Input paste file list*

All the columns in pastefile will be pasted on to infile. If pastefile is a stack, the columns from all the files in the stack will be used.

### **Parameter=outfile (file required filetype=output)**

*output file name.*

The output file containing a version of infile with the extra columns appended.

### **Parameter=clobber (boolean default=no)**

*Clobber existing files?*

Used to specify whether to clobber output file if it already exists.

### **Parameter=verbose (integer default=0 min=0 max=5)**

Amount of diagnostic chatter, 0 (least) to 5 (most).

### **Parameter=kernel (string default=default)**

*Output format*

Used to specify output file kernel, by default the same as the input file format.
