

AHELP for CIAO 3.4

int

Context: [slangrtl](#)

Jump to: [Description](#) [Example](#) [See Also](#)

Synopsis

Typecast an object to an integer

Syntax

```
int (s)
```

Description

This function performs a typecast of *s* from its data type to an object of `Integer_Type`. If *s* is a string, it returns the ascii value of the first character of the string *s*. If *s* is `Double_Type`, `int` truncates the number to an integer and returns it.

Example

`int` can be used to convert single character strings to integers. As an example, the intrinsic function `isdigit` may be defined as

```
define isdigit (s)
{
  if ((int (s) >= '0') and (int (s) <= '9')) return 1;
  return 0;
}
```

This function is equivalent to `typecast (s, Integer_Type)`;
