

*AHELP for CIAO 3.4*

punlearn

Context: [paramio](#)*Jump to:* [Description](#) [Example](#) [See Also](#)

Synopsis

Restore the system defaults for a parameter file from S-Lang.

Syntax

```
punlearn( paramfilespec )
```

Description

This function is essentially the same as the command-line version (see "ahelp tools punlearn"). To use it the paramio module must have been loaded. The input value can be one of:

- a string containing a single name
- a string containing multiple names, each separated by a space or a comma
- an array of strings, each string being the name of a single parameter file

Note that punlearn() does not accept a Param_File_Type variable – i.e. the output of paramopen().

As with all the paramio routines, the PF_Erno variable is set to 0 on success, or on error it is set to one of the error codes listed in the paramio documentation.

Example

```
chips> require("paramio")
chips> punlearn("dmextract")
chips> punlearn("dmextract dmclist")
chips> punlearn("dmextract dmclist, dmcopy")
chips> punlearn(["dmextract", "dmclist", "dmcopy"])
```

This example shows the different ways that punlearn() can be used.
