

*AHELP for CIAO 3.4*

# strreplace

Context: [slangrtl](#)*Jump to:* [Description](#) [Example](#) [See Also](#)

## Synopsis

Replace one or more substrings

## Syntax

```
(new, n) = strreplace (a, b, c, max_n)
```

## Description

```
String_Type a, b, c, rep;
Int_Type n, max_n;
```

The strreplace function may be used to replace one or more occurrences of b in a with c. If the integer max\_n is positive, then the first max\_n occurrences of b in a will be replaced. Otherwise, if max\_n is negative, then the last abs(max\_n) occurrences will be replaced.

The function returns the resulting string and an integer indicating how many replacements were made.

## Example

The following function illustrates how strreplace may be used to remove all occurrences of a specified substring

```
define delete_substrings (a, b)
{
    (a, ) = strreplace (a, b, "", strlen (a));
    return a;
}
```
